APPENDIX O-1.

Dependent Variable-Covariate Associations for the Immunology Assessment

This appendix contains results of tests of association between each dependent variable and candidate covariates for the adjusted analysis of each dependent variable. Pearson's chi-square test (continuity-adjusted for 2×2 tables) is used for the significance testing of the association between each discrete dependent variable and the candidate covariate. When a candidate covariate is continuous in nature (for example, age), the covariate is discretized prior to the analysis of the discrete dependent variable. Pearson's correlation coefficient is used for significance testing of the associations between each continuous dependent variable and a continuous candidate covariate. When a candidate covariate is discrete in nature, means (transformed back to the original scale, if necessary) are presented and an analysis of variance is used to investigate the difference between the means.

APPENDIX O-2.

Interaction Tables for the Immunology Assessment

This appendix contains exposure analyses results of interactions between covariates and group or dioxin. Results are presented for separate strata of the covariate and include sample sizes, percent abnormal, relative risks, confidence intervals, and p-values for discrete dependent variables. Sample sizes, adjusted means, differences of adjusted means and confidence intervals or adjusted slopes and standard errors, and p-values are given for continuous dependent variables. Means are transformed back to the original scale, if necessary. Chapter 7, Statistical Methods, provides further details on the analytical approaches used in the interaction analyses. The covariate involved in the interaction and a reference to the analysis table in Chapter 19 are given in the heading of each subtable. A summary of the interactions described in this appendix follows.

APPENDIX O-3.

Immunology Analysis Tables Occupation Removed from Final Model

This appendix contains results of exposure analyses after occupation has been removed from those final dioxin models (Models 2 through 6) that contained occupation. These analyses are performed to investigate the relationship of the dependent variable to dioxin without removing any effects due to occupation. The format of these tables closely parallels the adjusted panels of Chapter 19 tables. A summary of the tables found in this appendix follows.

Appendix O-3 Table	Chapter 19 Table	Dependent Variable

APPENDIX O-4.

Interaction Tables for the Immunology Assessment Occupation Removed from Final Model

This appendix contains exposure analyses results of interactions between covariates and dioxin after occupation and diabetic class have been removed from those final dioxin models (Models 2 through 6) that contained occupation. These tables are supplements to tables in Appendix O-3, which are main effects results with occupation removed from the model. Results are presented for separate strata of the covariate and include sample sizes, percent abnormal, relative risks, confidence intervals, and p-values for discrete dependent variables. Sample sizes, adjusted means, differences of adjusted means and confidence intervals or adjusted slopes and standard errors, and p-values are given for continuous dependent variables. Chapter 7, Statistical Methods, provides further details on the analytical approaches used in the interaction analyses. The analysis model, covariate involved in the interaction, and a reference to the analysis table in Chapter 19, Immunology Assessment, are given in the heading of each subtable. A summary of the interactions described in this appendix follows.

APPENDIX P-1.

Dependent Variable-Covariate Associations for the Pulmonary Assessment

This appendix contains results of tests of associations between each dependent variable and candidate covariates for the adjusted analysis of each dependent variable. Pearson's chi-square test (continuity-adjusted for 2×2 tables) is used for the significance testing of the associations between each discrete dependent variable and the candidate covariate. When a candidate covariate is continuous in nature (for example, age), the covariate is discretized prior to the analysis of the discrete dependent variable. Pearson's correlation coefficient is used for significance testing of the associations between each continuous dependent variable and a continuous candidate covariate. When a candidate covariate is discrete in nature, means (transformed back to the original scale, if necessary) are presented and an analysis of variance is used to investigate the difference between the means.

APPENDIX P-2.

Interaction Tables for the Pulmonary Assessment

This appendix contains exposure analyses results of interactions between covariates and group or dioxin. Results are presented for each separate stratum of the covariate and include sample sizes, percent abnormal, relative risks, confidence intervals, and p-values for discrete dependent variables. Sample sizes, adjusted means, differences of adjusted means and confidence intervals or adjusted slopes and standard errors, and p-values are given for continuous dependent variables. Means are transformed back to the original scale, if necessary. Chapter 7, Statistical Methods, provides further details on the analytical approaches used in the interaction analyses. The covariate involved in the interaction and a reference to the analysis table in Chapter 20 are given in the heading of each subtable. A summary of the interactions described in this appendix follows.

APPENDIX P-3.

Pulmonary Analysis Tables Occupation and Body Fat Removed from Final Model

This appendix contains results of exposure analyses after occupation and body fat have been removed from those final dioxin models (Models 2 through 6) that contained occupation or body fat. These analyses are performed to investigate the relationship of the dependent variable to dioxin without adjusting any effects due to occupation or body fat. The format of these tables closely parallels the adjusted panels of Chapter 20 tables. A summary of the tables found in this appendix follows.

Appendix P-3 Table	Chapter 20 Table	Dependent Variable

^b Adjusted for percent body fat at the time of duty in SEA, change in body fat from the time of duty in SEA to the date of the blood draw for dioxin, and covariates specified under "Covariate Remarks" column.

** Categorized dioxin-by-covariate interaction ($0.01 < p \leq 0.05$); adjusted relative risk, confidence interval, and p-value derived from a model after deletion of this interaction; refer to Appendix Table P-4-6 for further analysis of this interaction.

Note: RH = Ranch Hand.

Comparison: Current Dioxin ≤ 10 ppt.

Background (Ranch Hand): Current Dioxin ≤ 10 ppt.

Low (Ranch Hand): Current Dioxin > 10 ppt, 10 ppt $<$ Initial Dioxin ≤ 143 ppt.

High (Ranch Hand): Current Dioxin > 10 ppt, Initial Dioxin > 143 ppt.

APPENDIX P-4.

Interaction Tables for the Pulmonary Assessment Occupation and Body Fat Removed from Final Model

This appendix contains exposure analyses results of interactions between covariates and dioxin after occupation and body fat have been removed from those final dioxin models (Models 2 through 6) that contained occupation or body fat. These tables are supplements to tables in Appendix P-3, which are main effects results with occupation and body fat removed from the model. Results are presented for each separate stratum of the covariate and include sample sizes, percent abnormal, relative risks, confidence intervals, and p-values for discrete dependent variables. Sample sizes, adjusted means, differences of adjusted means and confidence intervals or adjusted slopes and standard errors, and p-values are given for continuous dependent variables. Means are transformed back to the original scale, if necessary. Chapter 7, Statistical Methods, provides further details on the analytical approaches used in the interaction analyses. The analysis model, covariate involved in the interaction, and references to the analysis tables in Chapter 20 and Appendix P-3 are given in the heading of each subtable. A summary of the interactions described in this appendix follows.

APPENDIX Q-1.

Summary of Analysis Results

This appendix contains a summary of the results from the exposure analyses performed for this report and contained in Chapters 9 through 20. This summary is organized into 24 tables, grouped by analysis (unadjusted, adjusted), data form (continuous, dichotomous, polychotomous), and model (1, 2, 3, and 4-6 combined). Each table contains a reference to its corresponding table in Chapters 9 through 20 and a description of the clinical parameter being summarized. The summary statistics, grouped by model and presented for each analysis and data form, are described below.

Model 1

For analyses of continuous data using Model 1 (Tables Q-1-1 and Q-1-13), the occupational category, Ranch Hand mean, Comparison mean, difference of Ranch Hand and Comparison means along with the associated 95 percent confidence interval (C.I.), and p-value are given for the unadjusted and adjusted analyses. For analyses of dichotomous data using Model 1 (Tables Q-1-5 and Q-1-17), the occupational category, estimated or adjusted relative risk and associated 95 percent confidence interval, and p-value are given for the unadjusted and adjusted analyses. The percentage of abnormalities within the Ranch Hand and Comparison groups are given for the unadjusted analyses. For analyses of polychotomous data using Model 1 (Tables Q-1-9 and Q-1-21), the contrast (of the specified abnormal category versus the normal category), occupational category, estimated or adjusted relative risk and associated 95 percent confidence interval, and p-value are given for the unadjusted and adjusted analyses. The percentage of Ranch Hands and Comparisons within each abnormal level are given for the unadjusted analyses.

Models 2, 4, 5, and 6

For analyses of continuous data using Models 2, 4, 5, and 6 (Tables Q-1-2 and Q-1-14 for Model 2; Tables Q-1-4 and Q-1-16 for Models 4, 5, and 6), the coefficient of determination (R^2), slope, standard error, and p-value are given for the unadjusted and adjusted analyses. For analyses of dichotomous data using Models 2, 4, 5, and 6 (Tables Q-1-6 and Q-1-18 for Model 2; Tables Q-1-8 and Q-1-20 for Models 4, 5, and 6), the estimated or adjusted relative risk and associated 95 percent confidence interval, and p-value are given for the unadjusted and adjusted analyses. For analyses of polychotomous data using Models 2, 4, 5, and 6 (Tables Q-1-10 and Q-1-22 for Model 2; Tables Q-1-12 and Q-1-24 for Models 4, 5, and 6), the contrast (of the specified abnormal category versus the normal category), the estimated or adjusted relative risk and associated 95 percent confidence interval, and p-value are given for the unadjusted and adjusted analyses.

Model 3

For analyses of continuous data using Model 3 (Tables Q-1-3 and Q-1-17), the R^2 , dioxin category, dioxin category sample size (n) and mean, difference of Ranch Hand dioxin

category and Comparison dioxin category means along with the associated 95 percent confidence interval, and p-value are given for the unadjusted and adjusted analyses. For analyses of dichotomous data using Model 3 (Tables Q-1-7 and Q-1-19), the dioxin category, sample size, estimated or adjusted relative risk and associated 95 percent confidence interval for each Ranch Hand category versus Comparison contrast, and p-value are given for the unadjusted and adjusted analyses. The percentage of abnormalities within each dioxin category are given for unadjusted analyses. For analyses of polychotomous data using Model 3 (Tables Q-1-11 and Q-1-23), the contrast (of the specified abnormal category versus the normal category), dioxin category, sample size, estimated or adjusted relative risk and associated 95 percent confidence interval for each Ranch Hand category versus Comparison contrast, and p-value are given for the unadjusted and adjusted analyses. The percentages of each abnormal level within each dioxin category are given for the unadjusted analyses.

A summary of the analysis (unadjusted, adjusted), data form (continuous, dichotomous, polychotomous), and model (1, 2, 3, and 4-6 combined) for each table in Appendix Q-1 is given below.

^a Adjusted for percent body fat at the time of duty in SEA and change in percent body fat from the time of duty in SEA to the date of the blood draw for dioxin.

^b Slope and standard error based on natural logarithm of clinical parameter versus log₂ (initial dioxin).

^c Slope and standard error based on natural logarithm of (clinical parameter + 0.1) versus log₂ (initial dioxin).

^d Slope and standard error based on square root of clinical parameter versus log₂ (initial dioxin).

^e Slope and standard error based on time to diabetes onset versus log₂ (initial dioxin) under a censored Weibull distribution.

^f Slope and standard error based on natural logarithm of (clinical parameter + 1) versus log₂ (initial dioxin).

^g Slope and standard error based on natural logarithm of (1 - clinical parameter) versus log₂ (initial dioxin).

--: R-squared not presented because analysis was based on a censored Weibull distribution.

^a Adjusted for percent body fat at the time of duty in SEA and change in percent body fat at the time of duty in SEA to the date of the blood draw for dioxin.

^b Means transformed from natural logarithm scale; difference of means after transformation to original scale; confidence interval not given because analysis was performed on natural logarithm scale; p-value based on difference of means on natural logarithm scale.

^c Means transformed from natural logarithm (clinical parameter + 0.1) scale; difference of means after transformation to original scale; confidence interval not given because analysis was performed on natural logarithm (clinical parameter + 0.1) scale; p-value based on difference of means on natural logarithm (clinical parameter + 0.1) scale.

^d Means transformed from square root scale; difference of means after transformation to original scale; confidence interval not given because analysis was performed on square root scale; p-value based on difference of means on square root scale.

^e Coefficient and standard error for Ranch Hand versus Comparison contrast in a failure time analysis model, using a censored Weibull distribution.

^f Means transformed from natural logarithm (clinical parameter + 1) scale; difference of means after transformation to original scale; confidence interval not given because analysis was performed on natural logarithm (clinical parameter + 1) scale; p-value based on difference of means on natural logarithm (clinical parameter + 1) scale.

^g Means transformed from natural logarithm (1 - clinical parameter) scale; difference of means after transformation to original scale; confidence interval not given because analysis was performed on natural logarithm (1 - clinical parameter) scale; p-value based on difference of means on natural logarithm (1 - clinical parameter) scale.

Note: RH = Ranch Hand.

Comparison: Current Dioxin \leq 10 ppt.

Background (Ranch Hand): Current Dioxin \leq 10 ppt.

Low (Ranch Hand): Current Dioxin $>$ 10 ppt, 10 ppt $<$ Initial Dioxin \leq 143 ppt.

High (Ranch Hand): Current Dioxin $>$ 10 ppt, Initial Dioxin $>$ 143 ppt.

^a Adjusted for percent body fat at the time of duty in SEA and change in percent body fat from the time of duty in SEA to the date of the blood draw for dioxin.

--: Estimated relative risk, confidence interval, and p-value not presented due to the sparse number of abnormalities.

Note: Relative risk for a twofold increase in initial dioxin.

Summary of Unadjusted Results for Dichotomous Variables
Model 3: Ranch Hands and Comparisons by Dioxin Category

Table Ref.	Clinical Parameter	Dioxin Category	n	Percent Abnormal	Est. Relative Risk (95% C.I.) ^{ab}	p-Value ^a
20-7	X Ray Interpretation	Comparison	1,063	13.7		
		Background RH	374	14.4	1.06 (0.75,1.48)	0.756
		Low RH	260	13.5	0.98 (0.66,1.45)	0.901

		Low plus High RH	519	12.5	0.90 (0.66,1.23)	0.515

^a Adjusted for percent body fat at the time of duty in SEA and change in percent body fat from the time of duty in SEA to the date of the blood draw for dioxin.

^b Relative risk and confidence interval relative to Comparisons.

--: Estimated relative risk, confidence interval, and p-value not presented due to the sparse number of abnormalities.

Note: RH = Ranch Hand.

Comparison: Current Dioxin \leq 10 ppt.

Background (Ranch Hand): Current Dioxin \leq 10 ppt.

Low (Ranch Hand): Current Dioxin $>$ 10 ppt, 10 ppt $<$ Initial Dioxin \leq 143 ppt.

High (Ranch Hand): Current Dioxin $>$ 10 ppt, Initial Dioxin $>$ 143 ppt.

Model 5: Log₂ (whole-weight current dioxin + 1).

Model 6: Log₂ (whole-weight current dioxin + 1), adjusted for log₂ total lipids.

--: Estimated relative risk, confidence interval, and p-value not presented due to the sparse number of abnormalities.

Note: Relative risk for a twofold increase in current dioxin.

^a Adjusted for percent body fat at the time of duty in SEA, change in percent body fat from the time of duty in SEA to the date of the blood draw for dioxin, and the covariates specified in the referenced chapter table.

^b Slope and standard error based on natural logarithm of clinical parameter versus log₂ (initial dioxin).

^c Slope and standard error based on natural logarithm of (clinical parameter + 0.1) versus log₂ (initial dioxin).

^d Slope and standard error based on square root of clinical parameter versus log₂ (initial dioxin).

^e Slope and standard error based on time to diabetes onset versus log₂ (initial dioxin) under a censored Weibull distribution.

^f Slope and standard error based on natural logarithm of (clinical parameter + 1) versus log₂ (initial dioxin).

^g Slope and standard error based on natural logarithm of (1 - clinical parameter) versus log₂ (initial dioxin).

--: R-squared not presented because analysis was based on a censored Weibull distribution.

** Log₂ (initial dioxin)-by-covariate interaction ($p \leq 0.05$); adjusted slope, standard error, and p-value derived from a model fitted after deletion of this interaction.

**** Log₂ (initial dioxin)-by-covariate interaction ($p \leq 0.01$); adjusted slope, standard error, and p-value not presented.

^a Adjusted for percent body fat at the time of duty in SEA, change in percent body fat at the time of duty in SEA to the date of the blood draw for dioxin, and the covariates specified in the referenced chapter table.

^b Means transformed from natural logarithm scale; difference of means after transformation to original scale; confidence interval not given because analysis was performed on natural logarithm scale; p-value based on difference of means on natural logarithm scale.

^c Means transformed from natural logarithm (clinical parameter + 0.1) scale; difference of means after transformation to original scale; confidence interval not given because analysis was performed on natural logarithm (clinical parameter + 0.1) scale; p-value based on difference of means on natural logarithm (clinical parameter + 0.1) scale.

^d Means transformed from square root scale; difference of means after transformation to original scale; confidence interval not given because analysis was performed on square root scale; p-value based on difference of means on square root scale.

^e Coefficient and standard error for Ranch Hand versus Comparison contrast in a failure time analysis model, using a censored Weibull distribution.

^f Means transformed from natural logarithm (clinical parameter + 1) scale; difference of means after transformation to original scale; confidence interval not given because analysis was performed on natural logarithm (clinical parameter + 1) scale; p-value based on difference of means on natural logarithm (clinical parameter + 1) scale.

^g Means transformed from natural logarithm (1 - clinical parameter) scale; difference of means after transformation to original scale; confidence interval not given because analysis was performed on natural logarithm (1 - clinical parameter) scale; p-value based on difference of means on natural logarithm (1 - clinical parameter) scale.

--: R-squared, adjusted mean, difference of adjusted means, and confidence interval not presented because analysis was based on a censored Weibull distribution.

** Categorized dioxin-by-covariate interaction ($p \leq 0.05$); adjusted mean, difference of adjusted means, confidence interval, and p-value derived from a model fitted after deletion of this interaction.

**** Categorized dioxin-by-covariate interaction ($p \leq 0.01$); adjusted mean, difference of adjusted means, confidence interval, and p-value not presented.

Note: RH = Ranch Hand.

Comparison: Current Dioxin ≤ 10 ppt.

Background (Ranch Hand): Current Dioxin ≤ 10 ppt.

Low (Ranch Hand): Current Dioxin > 10 ppt, 10 ppt $<$ Initial Dioxin ≤ 143 ppt.

High (Ranch Hand): Current Dioxin > 10 ppt, Initial Dioxin > 143 ppt.

^a Adjusted for percent body fat at the time of duty in SEA, change in percent body fat from the time of duty in SEA to the date of the blood draw for dioxin, and covariates specified in the referenced chapter title.

** Log₂ (initial dioxin)-by-covariate interaction ($p \leq 0.05$); adjusted relative risk, confidence interval, and p-value derived from a model fitted after deletion of this interaction.

**** Log₂ (initial dioxin)-by-covariate interaction ($p \leq 0.01$); adjusted relative risk, confidence interval, and p-value not given.

--: Adjusted relative risk, confidence interval, and p-value not presented due to the sparse number of abnormalities.

Note: Relative risk for a twofold increase in initial dioxin.

^a Adjusted for percent body fat at the time of duty in SEA, change in percent body fat from the time of duty in SEA to the date of the blood draw for dioxin, and covariates specified in the referenced chapter table.

^b Relative risk and confidence interval relative to Comparisons.

** Categorized dioxin-by-covariate interaction ($p \leq 0.05$); adjusted relative risk, confidence interval, and p-value derived from a model fitted after deletion of this interaction.

**** Categorized dioxin-by-covariate interaction ($p \leq 0.01$); adjusted relative risk, confidence interval, and p-value not presented.

--: Adjusted analysis not performed due to sparse number of abnormalities; sample size, adjusted relative risk, confidence interval, and p-value not presented due to the sparse number of abnormalities.

Note: RH = Ranch Hand.

Comparison: Current Dioxin ≤ 10 ppt.

Background (Ranch Hand): Current Dioxin ≤ 10 ppt.

Low (Ranch Hand): Current Dioxin > 10 ppt, $10 \text{ ppt} < \text{Initial Dioxin} \leq 143$ ppt.

High (Ranch Hand): Current Dioxin > 10 ppt, Initial Dioxin > 143 ppt.

Model 5: Log₂ (whole-weight current dioxin + 1).

Model 6: Log₂ (whole-weight current dioxin + 1), adjusted for log₂ total lipids.

** Log₂ (current dioxin + 1)-by-covariate interaction ($p \leq 0.05$); adjusted relative risk, confidence interval, and p-value derived from a model fitted after deletion of this interaction.

**** Log₂ (current dioxin + 1)-by-covariate interaction ($p \leq 0.01$); adjusted relative risk, confidence interval, and p-value not presented.

--: Adjusted relative risk, confidence interval, and p-value not presented due to the sparse number of abnormalities.

Note: Relative risk for a twofold increase in current dioxin.

APPENDIX Q-2.

Graphical Presentations of Continuous Clinical Parameters versus Current Dioxin

This appendix contains bivariate scatterplots describing the relationship between selected clinical parameters and lipid-adjusted current dioxin. The clinical parameter transformation used in the statistical analysis has been used in the scatterplots, and consequently the axis marks are equally spaced on the transformed scale. The axis marks for current lipid-adjusted dioxin are equally spaced for twofold increases, because a logarithmic (base 2) transformation was used. For the scatterplots, the reference line indicates the general relationship, unadjusted for any covariates, between the (transform of the) clinical parameter and \log_2 (current lipid-adjusted dioxin + 1). Participants excluded from the analyses are not displayed on these scatterplots, and consequently the graphical displays parallel the unadjusted Model 4 analyses of these selected clinical parameters.

A listing of the clinical parameter presented in each graphical display, along with a reference to a table in Chapters 9 through 20 and the transformation used on the clinical parameter, is given below.

Glossary of Abbreviations and Acronyms

A

A	= adjusted analyses
ACA	= automated chemical analyzer
ACTH	= adrenocorticotrophic hormone
Adj. Mean	= adjusted mean
Adj. RR	= adjusted relative risk
Adj. Slope	= adjusted slope
AFB	= Air Force base
AFHS	= Air Force Health Study
AGE	= age at the 1992 physical examination
Ah	= aryl hydrocarbon
AIDS	= acquired immunodeficiency syndrome
ALC	= current alcohol use
ALT	= alanine aminotransferase
AST	= aspartate aminotransferase

B

BMDP®-4F	= BMDP log-linear program
BMDP®-LR	= BMDP logistic regression program
BMDP®-PR	= BMDP polychotomous logistic regression program

C

C	= Celsius
C	= Comparison
C	= continuous analysis only
CALINT	= caloric intake
CDC	= Centers for Disease Control

CHD = chronic heart disease
 CHOL = cholesterol
 CHOL/HDL = cholesterol-HDL ratio
 C.I. = confidence interval
 CMI = Cornell Medical Index
 CNF = cranial nerve function
 CNS = Central Nervous System
 COV = covariate (missing data)
 cpm = counts per minute
 CS = chi-square contingency table analysis (continuity-adjusted for 2x2 tables)
 CSMOK = current cigarette smoking
 CURR = \log_2 (current dioxin + 1)
 CV = coefficient of variation

D

D = discrete analysis only
 DC = degreasing chemical exposure
 D/C = discrete and continuous analyses for dependent variables; appropriate form
 for analysis (either discrete or continuous) for covariates
 DCH = delayed cutaneous hypersensitivity
 DEP = dependent variable (missing data)
 DIAB = diabetic class
 DNA = deoxyribonucleic acid
 DRKYR = lifetime alcohol history
 DXCAT = categorized dioxin

E

ECG = electrocardiograph or electrocardiogram
 EDUC = education
 ESR = erythrocyte sedimentation rate

Est. RR = estimated relative risk

EXC = exclusion

F

FC = fully compliant at Baseline

FEV = forced expiratory volume

FEV₁ = forced expiratory volume in 1 second

FIR CUSUM = fast initial response cumulative sum

FSH = follicle stimulating hormone

FTI = free thyroxine index

FVC = forced vital capacity

G

GGT = gamma glutamyl transferase

GLM = general linear models analysis

GML = good result, missing lipids

GND = good result, below limit of detection

GNQ = good result, below limit of quantification

GnRH = gonadotropin-releasing hormone

GRc = glucocorticoid

GSI = global severity index

G-6-PD = glucose-6-phosphate dehydrogenase

H

HB_sA_g = hepatitis B surface antigen

HDL = high-density lipoprotein

HIV = human immunosuppressant virus

HPF = high-power field

HRB = Halstead-Reitan battery

HRTDIS = family history of heart disease

HRTDIS50 = family history of heart disease before age 50

I

IC = industrial chemical exposure
ICD = International Classification of Disease
ICD-9 = International Classification of Disease, 9th Edition
ICD-9-CM = International Classification of Disease, 9th Edition, Clinical Modification
ICVI = intermittent claudication and vascular insufficiency
IL = Interleukin
IL-2 = Interleukin-2
INIT = log₂ (initial dioxin)
INS = insecticide exposure
IQ = intelligence quotient

JK

KUB = kidney, urethra, and bladder

L

L = longitudinal analysis
LAB = 1992 laboratory results
LAB-AF = 1992 Brooks AFB laboratory results
LAT = average lifetime residential latitude
LBBB = left bundle branch block
LDH = lactic dehydrogenase
LH = luteinizing hormone
LR = logistic regression analysis
LWINE = lifetime wine history

M

MCH = mean corpuscular hemoglobin
MCHC = mean corpuscular hemoglobin concentration
MCMI = Millon Clinical Multiaxial Inventory

MCV = mean corpuscular volume
MIL = Air Force military records
MLC = mixed lymphocyte culture
MMPI = Minnesota Multiphasic Personality Inventory
MR-V = medical records (verified)
MSK = mouse stomach kidney

N

NHL = non-Hodgkin's lymphoma
NIH = National Institutes of Health
NIOSH = National Institute for Occupational Safety and Health
NKC = natural killer cell
NORC = National Opinion Research Center
NR = no result
NS = new to study since Baseline (Chapter 5)
NS = not significant
NS* = marginally significant

O

OCC = occupation
OMR = optical mark recognition

P

PACKYR = lifetime cigarette smoking history
PBF = percent body fat
PC = partially compliant at Baseline
PCT = porphyria cutanea tarda
PE = physical examination
PHA = phytohemagglutinin
ppm = parts per million
ppq = parts per quadrillion

ppt = parts per trillion
 PR = polychotomous logistic regression analysis
 PSA = prostate-specific antigen
 PSDI = positive symptom distress index
 PST = positive symptom total
 PTSD = post-traumatic stress disorder
 PWM = pokeweed mitogen

Q

QA = quality assurance
 QC = quality control
 QRC = Quality Review Committee
 Q-SR = health questionnaire (self-reported)
 Q-V = health questionnaire (verified)

R

R = refusal at Baseline
 R^2 = coefficient of determination
 RACE = race
 RBBB = right bundle branch block
 RBC = red blood cell
 RBC per HPF = red blood cells per high powered field
 RH = Ranch Hand
 RIA = radioimmunoassay
 RPM = revolutions per minute
 RR = relative risk
 RVN = Republic of Vietnam

S

SAIC = Science Applications International Corporation
 SAS®-GLM = SAS® general linear model

SCL-90-R = Symptom Check List-90-Revised
 SCRF = Scripps Clinic and Research Foundation
 SCS = Selected Cancers Study
 SEA = Southeast Asia
 SEAACNE = presence of pre-SEA acne
 SIRL = Scripps Immunology Reference Laboratory
 SKIN = skin color
 Std. Error = standard error
 STS = soft tissue sarcoma
 SUN2HR = reaction of skin to sun after at least 2 hours after first exposure (assuming several preceding episodes)
 SUNREAC = sun-reaction index
 SUNRPT = reaction of skin to sun after repeated exposure

T

T₄ = serum thyroxin
 T₃% = triiodothyronine percent
 TCDD = 2,3,7,8-tetrachlorodibenzo-p-dioxin
 TLC = total lymphocyte count
 TSH = thyroid stimulating hormone
 TT = two-sample t-test
 2,4-D = dichlorophenoxyacetic acid
 2,4,5-T = 2,4,5-trichlorophenoxyacetic acid

UVW

U = unadjusted analyses
 UNL = unlocatable at Baseline
 USAF = United States Air Force
 VA = Veterans' Administration
 VES = Vietnam Experience Study
 WBC = white blood cell

WBC per HPF = white blood cells per high-powered field

WHO = World Health Organization

WINE = current wine use
